PLATFORM USER MANUAL & TRADING OPERATIONS GUIDE

TrackingCrypt

Real-Time Cryptocurrency Price Variance & Execution Optimization Platform

---

The comprehensive, easy-to-understand manual for cryptocurrency traders, analysts, and portfolio operators. Explains the quote-to-fill price gap phenomenon, how to diagnose whether price differences are caused by technical latency or market microstructure, how to use the 20-level visual order book, and how to execute risk-free simulated orders using the paper trading engine.

DOCUMENT SPECIFICATIONS & CONTROL

Document Version:	1.0 Production Edition
Release Date:	October 2026
Target Audience:	Crypto Traders, Analysts, Operations Teams
Default Execution Mode:	Paper Trading Simulation ($10,000 USDT Virtual Balance)
Risk Controls:	Emergency Kill Switch, Pre-Trade Size Caps, Slippage Ceilings
Key Security Rule:	Zero Plaintext Keys; Withdrawal Rights Prohibited
Live Market Source:	Binance Public WebSocket Feeds (Sub-100ms Updates)
Supported Currency Pairs:	BTC/USDT, ETH/USDT, SOL/USDT, XRP/USDT, ADA/USDT, DOGE/USDT

OFFICIAL PROJECT DOCUMENTATION

This document represents the definitive reference manual for the TrackingCrypt real-time platform. All code samples, architectures, metrics, and workflows reflect the active codebase.

Executive Summary & How to Use This Manual

Welcome to TrackingCrypt. This platform was designed to give cryptocurrency market participants unprecedented clarity into what really happens between the second a price quote is viewed on an exchange and the moment an order is confirmed.

> **The Trader Guarantee: Safe by Default**
> TrackingCrypt operates in Paper Trading Simulation mode by default. You can test order types, inspect order books, and analyze slippage curves with complete peace of mind. Real capital is never placed at risk without explicit opt-in and multi-factor safety confirmations.

How This Guide Is Organized

- **Foundations (Chapters 3–11):** Explains what price gaps are, why they happen, and how market microstructure works.
- **Platform Navigation (Chapters 12–16):** Walks you through every screen: Overview, Live Markets, and Order Books.
- **Trading & Simulation (Chapters 17–21):** Covers paper trading, slippage curves, order types, and portfolio tracking.
- **Diagnostics & Safety (Chapters 22–26):** Covers gap diagnostics, alerts, Emergency Kill Switch, and API key protection.
- **Best Practices & FAQs (Chapters 27–30):** Practical tips, step-by-step trading scenarios, and complete glossary.

Table of Contents — Chapters 1 through 30

Quickly navigate to any section of the user manual using the chapter reference guide below:

Chapter	Title & Subject Matter	Page
Ch. 1	Cover Page & Document Control	Page 1
Ch. 2	Executive Summary & How to Use This Manual	Page 2
Ch. 3	Introduction to TrackingCrypt & The Price Gap Problem	Page 4
Ch. 4	Core Benefits & Value Proposition for Traders	Page 5
Ch. 5	System Requirements, Supported Devices & Browsers	Page 6
Ch. 6	Accessing the Platform & Top Navigation Bar	Page 7
Ch. 7	Understanding the Overview Dashboard (/dashboard)	Page 8
Ch. 8	Understanding Live Cryptocurrency Prices & Market Tickers	Page 9
Ch. 9	Buy Prices, Sell Prices, Spreads & Market Volatility	Page 10
Ch. 10	Why Displayed Quotes Differ from Final Executions (₹101 to ₹103)	Page 11
Ch. 11	Understanding Price Refresh Delays & Data Timestamps	Page 12
Ch. 12	Searching & Selecting Supported Trading Pairs	Page 13
Ch. 13	Reading the 20-Level Visual Order Book & Depth Ladders	Page 14
Ch. 14	Liquidity Depth Bands (±0.5%, ±1%, ±2%) & Order Imbalance	Page 15
Ch. 15	User Registration, Login & Session Management	Page 16
Ch. 16	Account Settings, Currency Preferences & Themes	Page 17
Ch. 17	Automated Alert Rules Engine & Notifications (/dashboard/alerts)	Page 18
Ch. 18	Interactive Slippage Estimator & Dynamic Sizing Curves	Page 19
Ch. 19	Step-by-Step Order Placement & Simulation (/dashboard/orders)	Page 20
Ch. 20	Order Types Explained: Market, Limit, Post-Only, IOC, FOK	Page 21
Ch. 21	Virtual Portfolio Management & Transaction Fill History	Page 22
Ch. 22	Analyzing Price Gaps & Diagnostic Tools (/dashboard/price-gap)	Page 23
Ch. 23	The Six Root-Cause Categories Explained in Plain English	Page 24
Ch. 24	Historical Analytics Dashboard & Latency Percentiles	Page 25
Ch. 25	Emergency Kill Switch & Risk Settings (/dashboard/settings)	Page 26
Ch. 26	Connecting Exchange API Keys & Least-Privilege Rules	Page 27
Ch. 27	Best Practices for Minimizing Slippage & Capital Leakage	Page 28
Ch. 28	Troubleshooting Common Website Issues & FAQs	Page 29
Ch. 29	Three Real-World Trader Walkthrough Scenarios	Page 30
Ch. 30	Cryptocurrency Trading Glossary & Final Sign-Off	Page 31

Chapter 3: Introduction to TrackingCrypt & The Price Gap

Cryptocurrency trading is fast-paced, highly volatile, and executed across geographically dispersed exchange servers. Every trader has experienced the disappointment of seeing an attractive price on their screen, submitting a trade, and finding out their order was executed at a significantly worse price.

What is a Price Gap?

A price gap is the numerical and percentage difference between the price an exchange displays to you as a buyer or seller, and the actual volume-weighted price at which your transaction fills.

> **Key Takeaway for Traders**
> A price gap is not always an error or technical bug. It is usually the natural consequence of how exchange order books work. TrackingCrypt shows you exactly which portion of the price difference is due to spread, which is due to your order size, and which is due to network delays.

Why Does TrackingCrypt Exist?

- **Identify Hidden Costs:** Expose the invisible costs of crossing spreads and order book slippage before committing funds.
- **Eliminate False Assumptions:** Distinguish market momentum from network latency so you make informed trading decisions.
- **Simulate Safely:** Test complex order types (Post-Only, IOC, FOK) with virtual funds against real exchange depth.

Chapter 4: Core Benefits & Value Proposition for Traders

Whether you are an individual retail trader or managing institutional crypto assets, TrackingCrypt provides four core pillars of value:

Pillar of Value	Platform Feature	Direct Benefit to Trader
Pre-Trade Clarity	Interactive Slippage Estimator	See exactly how much price slippage your order size will cause before buying.
Root-Cause Diagnosis	Price Gap Classification Engine	Instantly know whether a ₹2 price increase was spread, momentum, or delay.
Capital Protection	Emergency Kill Switch & Caps	Prevent catastrophic fat-finger losses with hard USD caps and one-click halts.
Zero-Risk Practice	Paper Trading Matching Engine	Master limit order execution and order book reading with $10,000 virtual USDT.

Who Uses TrackingCrypt?

- **Retail Spot Traders:** To stop losing 0.5%–2.0% on every trade due to aggressive market orders.
- **Algorithmic Traders:** To verify latency percentiles (p50, p90, p99) and tune execution speed.
- **Crypto Fund Managers:** To audit order execution quality and maintain immutable compliance logs.

Chapter 5: System Requirements & Supported Devices

TrackingCrypt is a web-based platform engineered to run smoothly on desktop browsers with zero software installation required.

Supported Web Browsers

Browser	Minimum Version	Recommended Settings
Google Chrome	Version 110 or higher	Hardware acceleration enabled for smooth SVG charting.
Microsoft Edge	Version 110 or higher	Default settings; optimal rendering engine.
Mozilla Firefox	Version 115 or higher	WebSocket connections enabled; disable aggressive ad-blockers.
Apple Safari	Version 16.0 or higher	Supported on macOS Ventura and Sonoma.

Hardware & Network Recommendations

- **Display Resolution:** Minimum 1280x720; 1920x1080 (Full HD) recommended for viewing 20-level order books.
- **Internet Connection:** Broadband internet with stable ping (<100ms) to ensure real-time WebSocket streaming.

Chapter 6: Accessing the Platform & Navigation Layout

The TrackingCrypt interface is organized into a persistent left-hand navigation sidebar, a top status bar, and a main operational viewport.

Navigating the Sidebar Menu

Sidebar Icon & Title	Destination URL	Primary Function
Overview	/dashboard	Summary of active markets, recent price gaps, and portfolio equity.
Live Markets	/dashboard/markets	Real-time ticker stream and 20-level visual order book.
Price Gap Analysis	/dashboard/price-gap	Interactive quote diagnostic tool with root-cause categorization.
Historical Analytics	/dashboard/analytics	Statistical latency percentiles and gap frequency charts.
Orders & Paper Trading	/dashboard/orders	Slippage estimator curve and paper trade execution form.
Alert Rules	/dashboard/alerts	Configurable threshold alerts and notification logs.
Settings & Safety	/dashboard/settings	Emergency Kill Switch, pre-trade risk limits, and key vault.

The Top Status Ribbon

The top header displays active market connection status (Binance WebSocket: CONNECTED), your current execution mode (PAPER TRADING), and the status of the Emergency Kill Switch (STANDBY vs HALTED).

Chapter 7: Understanding the Overview Dashboard

When you log into TrackingCrypt, the Overview dashboard (/dashboard) gives you an executive bird's-eye view of your trading environment.

Key Widgets on the Overview Page

- **Active Market Tickers Ribbon:** Displays real-time prices for BTC/USDT, ETH/USDT, SOL/USDT with 24h percentage change.
- **Active Price Gaps Card:** Highlights cryptocurrency pairs currently experiencing abnormal quote-to-fill variances.
- **Portfolio Equity Summary:** Real-time total value of your virtual USDT and crypto holdings marked-to-market.
- **Latency Health Monitor:** Displays current end-to-end latency (typically 40–80ms) and network connection health.

> **Tip for Fast Daily Checks**
> Before trading, glance at the Latency Health Monitor. If latency is below 100ms and the kill switch is on Standby, your trading environment is healthy.

Chapter 8: Understanding Live Cryptocurrency Prices

Cryptocurrency prices move every millisecond. TrackingCrypt streams live prices directly from Binance public feeds without requiring you to refresh the webpage.

Deconstructing the Market Ticker Card

Ticker Metric	Example Value	What It Tells You
Best Bid	$50,000.00	The highest price that buyers in the market are currently offering.
Best Ask	$50,020.00	The lowest price that sellers in the market are willing to accept.
Mid-Price	$50,010.00	The exact statistical midpoint between the best bid and best ask.
Spread ($)	$20.00	The dollar cost of crossing the market immediately.
Spread (%)	0.0400%	The spread expressed as a percentage of mid-price. Tighter is better.
Data Age	42 ms	How many milliseconds ago this quote was generated on the exchange.

Chapter 9: Buy Prices, Sell Prices & Bid-Ask Spreads

Every financial market has two prices at any given moment: the price you buy at (Ask) and the price you sell at (Bid).

Crossing the Spread: The Instant Cost

If you place an immediate "Market Order", you must pay the seller's Ask price. If you immediately turn around and sell it, you receive the buyer's Bid price. The difference between those two prices is the bid-ask spread.

> **The Golden Rule of Market Orders**
> The moment you execute a market BUY order, your position immediately starts at a slight loss equal to the bid-ask spread plus the exchange fee. To avoid this, professional traders use LIMIT orders.

Market Volatility & Price Drift

During periods of high market volatility (e.g. major news announcements), the best ask can jump upward in fractions of a second, creating a large price difference before your order reaches the exchange.

Chapter 10: Why Quotes Differ from Fills (₹101 to ₹103)

Let us examine in detail the classic scenario that inspired the creation of TrackingCrypt.

Step-by-Step Breakdown of the Scenario

- **Step 1 (Quote Viewed):** A seller lists 1.0 unit of crypto at ₹101. The buyer sees ₹101 on screen at 10:00:00 AM.
- **Step 2 (Human Delay):** The buyer spends 2.5 seconds reviewing the order and clicks "Buy" at 10:00:02.5 AM.
- **Step 3 (Market Execution):** The order reaches the exchange at 10:00:02.6 AM and executes at ₹103. Total difference: +₹2 (+1.98%).

Evaluating the Actual Causes

Hypothetical Cause	Was it the culprit?	How TrackingCrypt Verifies This
Technical Delay?	Partially (60ms network transit)	LatencyOptimizationService verifies exchange timestamp vs server arrival.
Market Movement?	Yes (+1.50% external price drift)	PriceGapDetectionService checks if mid-price rose across all exchanges.
Order Size / Depth?	Yes (Level-1 liquidity was exhausted)	OrderBookService checks if the ₹101 level only had 0.2 units available.
Exchange Fees?	Yes (0.10% taker fee = ₹0.10)	Fee multiplier is explicitly added to estimated execution price.

Chapter 11: Price Refresh Delays & Data Timestamps

Understanding timestamps is critical to knowing whether your screen is showing live data or delayed data.

The Data Age Indicator

On every market card, TrackingCrypt displays a small badge showing "Data Age: XX ms". Here is how to interpret it:

Data Age Value	Status Badge	What It Means for You
Under 100 ms	Green (EXCELLENT)	Fresh real-time streaming data. Highly safe to evaluate execution.
100 ms to 500 ms	Blue (NORMAL)	Acceptable internet latency. Typical for retail broadband connections.
500 ms to 2,000 ms	Amber (DEGRADED)	Noticeable lag. Market prices may have moved slightly ahead of your screen.
Over 5,000 ms	Red (STALE DATA)	Connection stalled. Do NOT place market orders until data re-synchronizes.

Chapter 12: Searching & Selecting Supported Currency Pairs

TrackingCrypt monitors 6 major cryptocurrency trading pairs representing the highest liquidity in global crypto markets.

Supported Trading Pairs

Trading Pair	Base Currency	Quote Currency	Market Characteristics
BTC/USDT	Bitcoin (BTC)	Tether (USDT)	Deepest liquidity globally; tightest spreads (often < 0.02%).
ETH/USDT	Ethereum (ETH)	Tether (USDT)	Very high volume; excellent depth for orders up to $100k.
SOL/USDT	Solana (SOL)	Tether (USDT)	High retail activity; moderate volatility and rapid price swings.
XRP/USDT	Ripple (XRP)	Tether (USDT)	Sub-dollar pricing; high order volume with distinct depth walls.
ADA/USDT	Cardano (ADA)	Tether (USDT)	Lower unit cost; wide depth bands requiring careful limit sizing.
DOGE/USDT	Dogecoin (DOGE)	Tether (USDT)	High momentum volatility; susceptible to rapid spread widening.

Chapter 13: Reading the 20-Level Visual Order Book

The visual order book on the Live Markets page (/dashboard/markets) is one of the most powerful tools in TrackingCrypt.

Anatomy of the Visual Order Book

- **Green Bids Column (Left):** Represents buyers waiting in line. Ordered from highest bid price down to lower bids.
- **Red Asks Column (Right):** Represents sellers waiting in line. Ordered from lowest ask price up to higher asks.
- **Cumulative Total Bar:** The shaded background bar shows the running cumulative volume available down to that level.

> **How Large Orders Eat the Book**
> If you place a market BUY order for 5.0 BTC, but the top ask level only has 1.0 BTC, the exchange automatically buys 1.0 BTC at Level 1, then buys 2.0 BTC at Level 2 (higher price), and buys 2.0 BTC at Level 3 (even higher price). Your final execution price is the volume-weighted average (VWAP) across all three levels.

Chapter 14: Liquidity Depth Bands & Order Imbalance

Directly beneath the order book, TrackingCrypt computes liquidity depth bands and the order imbalance ratio.

The ±0.5%, ±1.0%, ±2.0% Depth Bands

Depth Band	Volume Meaning	How to Use It in Practice
Within ±0.5%	Immediate liquidity cushion.	Safe zone for instant market orders. Slippage will be negligible.
Within ±1.0%	Secondary liquidity barrier.	Maximum recommended size for a single trade without splitting.
Within ±2.0%	Deep market absorption limit.	If your order reaches this band, split it into smaller limit orders.

The Order Imbalance Ratio

The Imbalance Ratio compares total buying volume versus total selling volume in the visible book. A positive score (e.g. +0.45) indicates heavy buying pressure, suggesting price is likely to rise. A negative score (e.g. -0.38) indicates selling dominance.

Chapter 15: User Registration, Login & Sessions

TrackingCrypt provides password-protected accounts with encrypted credential storage.

Account Access Steps

- **1. Registering:** Visit /auth/register and provide your name, email, and a strong password (minimum 8 characters).
- **2. Logging In:** Visit /auth/login with your credentials. Development accounts are pre-seeded for testing.
- **3. Session Security:** Sessions are protected with encrypted HTTP-only JWT cookies that automatically expire.

> **Development Test Account Credentials**
> For local testing and demonstration: Email: dev@trackingcrypt.local | Password: DevPassword123!

Chapter 16: Account Settings & Profile Preferences

Customize your display preferences, currency standards, and risk tolerance on the Settings page (/dashboard/settings).

Customizable Settings

- **Preferred Currency:** Select INR (₹) or USD ($) as your primary display currency.
- **Max Slippage Tolerance (%):** Set your threshold (e.g. 0.50%). Orders exceeding this will be blocked.
- **Max Order Size ($):** Cap individual orders to prevent accidental oversized trades (default: $5,000 USD).
- **Theme Selector:** Toggle between Dark Fintech mode (recommended) and High Contrast mode.

Chapter 17: Automated Alert Rules & Notification Center

TrackingCrypt continuously monitors market conditions and alerts you when critical thresholds are breached.

Configurable Alert Types (/dashboard/alerts)

Alert Rule Type	Severity	Trigger Condition
GAP_EXCEEDED	WARNING	Triggers when a quote-to-fill price difference exceeds your configured tolerance.
DATA_STALE	WARNING	Triggers when market data age exceeds 5,000ms due to network issues.
WS_DISCONNECT	CRITICAL	Triggers if the exchange WebSocket drops and fails to reconnect.
MAX_BUY_EXCEEDED	INFO	Triggers when an ask price rises above your planned maximum purchase ceiling.

Intelligent Cooldown Deduplication

To prevent notification fatigue, alert rules include a 300-second cooldown period. Once triggered, the rule will not alert again until the cooldown expires.

Chapter 18: Interactive Slippage Estimator & Curves

Located on the Orders page (/dashboard/orders), the Slippage Estimator evaluates market depth before you execute.

How to Read the Slippage vs. Size Curve

The chart plots order quantity on the horizontal axis and expected slippage percentage on the vertical axis:

- **Flat Linear Section:** Small orders fit comfortably within top-of-book liquidity with <0.02% slippage.
- **The Inflection Point:** The point where order size exhausts Level 1 and begins consuming deeper, more expensive levels.
- **Steep Upward Curve:** Dangerous order sizes that cause exponential price impact. Consider reducing size.

Chapter 19: Step-by-Step Order Placement & Simulation

Follow these 5 steps to place a risk-free paper trade on the Orders dashboard:

5-Step Trading Simulation Guide

- **Step 1: Select Trading Pair:** Choose your desired cryptocurrency (e.g. BTC/USDT) from the dropdown.
- **Step 2: Choose Side & Type:** Select BUY or SELL, then pick an order type (LIMIT or POST_ONLY recommended).
- **Step 3: Enter Quantity & Price:** Input your desired volume and target price. The estimator updates instantly.
- **Step 4: Review Estimated Slippage:** Check the slippage estimate. If slippage exceeds 0.50%, consider lowering your size.
- **Step 5: Click "Submit Order":** The paper trading engine matches your order against live book depth and credits your portfolio.

Chapter 20: Order Types Explained: Market, Limit, Post-Only

Choosing the right order type is the single most effective way to eliminate price gaps.

Order Type	Execution Rule	Fee Category	Best Used When
MARKET	Fills immediately at best available prices. Incurs slippage.	Taker (0.10%)	Urgent entry where execution certainty is paramount.
LIMIT	Rests in the book at your target price. Zero slippage.	Maker (0.02%)	Standard trading where you set your maximum price.
POST_ONLY	Guaranteed Maker order. Canceled if it would cross spread.	Maker (0.02%)	Cost-minimizing strategies to guarantee zero spread crossing.
IOC	Immediate-or-Cancel. Partial fills allowed; remainder canceled.	Taker (0.10%)	Fast fills without leaving open unfilled limit orders.
FOK	Fill-or-Kill. Must fill 100% immediately or 100% canceled.	Taker (0.10%)	Block trades where partial fills break trading logic.

Chapter 21: Virtual Portfolio & Transaction Fill History

Track your performance and review past executions on the Orders page.

Portfolio Asset Balances

Your virtual account tracks USDT cash balance alongside active holdings in BTC, ETH, SOL, XRP, ADA, and DOGE. Positions are marked-to-market in real time using live mid-prices.

Order Audit History Ledger

Every executed order is logged with timestamp, effective VWAP fill price, total fees paid, and fill status (FILLED, PARTIALLY_FILLED, CANCELLED).

Chapter 22: Price Gap Diagnostics Tool (/dashboard/price-gap)

The dedicated diagnostic tool at /dashboard/price-gap allows you to enter any quoted price and see how it compares to live market execution.

How to Run a Diagnostic Analysis

- **1. Enter Quoted Price:** Type in the price quoted to you by a seller (e.g. ₹101.00).
- **2. Enter Order Quantity:** Input the amount of cryptocurrency you planned to buy.
- **3. Click "Analyze Price Gap":** The platform computes current VWAP, adds exchange fees, and calculates the variance.

Chapter 23: The Six Root Causes Explained in Plain English

When the diagnostic tool finishes, it assigns one of six primary root-cause classifications:

Classification	Plain English Explanation	What You Should Do Next
SPREAD	The gap is entirely due to the bid-ask spread.	Use POST_ONLY limit orders to earn maker fees instead.
MARKET_MOVEMENT	Market prices moved naturally while you were waiting.	Price drift is normal volatility. Re-evaluate entry price.
LIQUIDITY	Your order was too large for top-of-book depth.	Reduce order size or execute across multiple smaller orders.
FEES	The gap matches the 0.10% taker fee charged by the exchange.	Switch to maker orders to lower fees from 0.10% to 0.02%.
STALE_DATA	Your market data was delayed by more than 5 seconds.	Check your internet connection; wait for green data badge.
SLIPPAGE	Your order size swept multiple price levels in the book.	Use limit orders with strict price caps to prevent slippage.

Chapter 24: Historical Analytics & Latency Percentiles

The Analytics page (/dashboard/analytics) provides statistical insights into past price gap events and network latencies.

Understanding Latency Percentiles (p50, p90, p95, p99)

Percentile	Mathematical Meaning	Trader Interpretation
p50 (Median)	50% of all events were faster than this.	Your normal, day-to-day execution speed.
p90 Latency	90% of events were faster than this.	Slightly slower than normal; acceptable performance.
p95 Latency	95% of events were faster than this.	Minor network congestion threshold.
p99 Latency	99% of events were faster than this.	Worst-case performance outlier during high market stress.

Chapter 25: Emergency Kill Switch & Safety Settings

TrackingCrypt includes institutional safety controls to protect you against market flash crashes or runaway algorithms.

The Emergency Kill Switch

> **One-Click Trading Halt**
> Located at the top of the Settings page, clicking the red "ENGAGE KILL SWITCH" button instantly blocks all live order placement across all exchanges. Disengaging requires explicit confirmation.

Pre-Trade Safety Guardrails

- **Max Order Size Cap:** Blocks orders exceeding your configured limit (default: $5,000 USD).
- **Slippage Ceiling:** Blocks orders if estimated VWAP slippage exceeds your threshold (default: 1.00%).
- **Rate Limiter:** Limits submissions to 10 orders per minute to prevent accidental spamming.

Chapter 26: Connecting Exchange API Keys Safely

If you choose to enable live trading, you can connect exchange API keys in the Credential Vault on the Settings page.

Strict Least-Privilege Policy

> **Withdrawal Permissions Prohibited**
> TrackingCrypt strictly prohibits API keys with withdrawal permissions enabled. If you attempt to save a key with withdrawal rights, the system will immediately reject it with code WITHDRAWAL_PERMISSION_REJECTED. Only READ_ONLY or TRADE permissions are allowed.

How Your Keys Are Protected

Keys are encrypted using bank-grade AES-256-GCM authenticated encryption. Your secret key is never shown in the browser after entry and is masked as abcd••••••••3456.

Chapter 27: Best Practices for Minimizing Slippage

Follow these practical rules to minimize price gaps and execution slippage:

- **1. Use POST_ONLY Orders:** Guarantees you never cross the spread and ensures you receive maker fee discounts.
- **2. Check the Slippage Curve:** Always check the Slippage vs Size curve before placing orders larger than 1.0 BTC or 10.0 ETH.
- **3. Monitor the Imbalance Ratio:** Do not place market BUY orders when the imbalance ratio is strongly negative (heavy sell pressure).
- **4. Avoid Trading on Stale Data:** If the data age badge turns amber or red, wait for the websocket stream to re-synchronize.

Chapter 28: Troubleshooting & Frequently Asked Questions

Answers to the most common questions and operational troubleshooting steps.

Question / Issue	Answer / Resolution
Why was my order rejected?	Check if the order exceeded your $5,000 size cap or 1.0% slippage ceiling in Settings.
Is paper trading using real money?	No. Paper trading uses virtual simulated funds ($10,000 USDT) with zero real risk.
Why is data age red (>5s)?	Local network delay or temporary exchange WebSocket restart. Wait a few moments to refresh.
Can I trade on multiple exchanges?	Currently Binance public feeds are active. Additional exchanges are planned in future releases.

Chapter 29: Real-World Trader Walkthrough Scenarios

Three realistic step-by-step walkthroughs demonstrating everyday use of TrackingCrypt.

Scenario 1: Pre-Trade Slippage Sizing

- **Goal:** Buy $25,000 worth of Bitcoin without causing more than 0.20% slippage.
- **Action:** Open /dashboard/orders, input 0.5 BTC, and inspect the slippage curve. The curve indicates 0.12% slippage for 0.5 BTC. Proceed with LIMIT order.

Scenario 2: Investigating a Suspected Execution Lag

- **Goal:** Determine why an order filled at ₹103 instead of the viewed ₹101 quote.
- **Action:** Open /dashboard/price-gap, enter ₹101 as reference price. The diagnostic reveals classification MARKET_MOVEMENT (+1.50% external price drift). Technical delay was ruled out.

Scenario 3: Volatility Emergency Freeze

- **Goal:** Protect portfolio during an unexpected crypto market flash crash.
- **Action:** Go to /dashboard/settings and click "ENGAGE KILL SWITCH". All execution halts immediately.

Chapter 30: Glossary of Trading Terms & Document Sign-Off

Quick reference glossary of cryptocurrency trading terminology:

Term	Plain English Definition
Ask Price	The lowest price a seller in the market is willing to accept.
Bid Price	The highest price a buyer in the market is offering to pay.
Spread	The difference between the lowest ask price and highest bid price.
Slippage	The price difference caused when an order size exceeds top-of-book liquidity.
VWAP	Volume-Weighted Average Price: the average price paid across all consumed book levels.
Maker Order	An order that sits in the book waiting to be filled, earning lower fees.
Taker Order	An order that immediately takes liquidity from the book, paying higher fees.
Kill Switch	Emergency safety button that instantly stops all trade submissions.

TrackingCrypt User Manual Certification

TrackingCrypt User Manual v1.0 Production Edition compiled on October 29, 2026. Approved for all users and traders.
